Instructor: Prof Deebak B D - SCOPE

Lab report

Title of Lab: Sending in A Ring (Broadcast by Ring)

Assessment #: 10

Date: 18|10|2019

Author's name: Gagan Deep Singh

Registration ID: 17BCI0140

Lab section: Friday L59 + L60

AIM: Study the given C program that takes data from process zero and sends it to all of the other processes by sending it in a ring and its logical approach is based on MPI. That is, process i should receive the data and send it to process i+1, until the last process is reached. Analyse its key factors in terms of network application system.

Assume that the data consists of a single integer. Process zero reads the data from the user.

SOURCE CODE:

```
#include <stdio.h>
#include "mpi.h"
int main(argc, argv)
int argc;
char **argv;
{
    int rank, value, size;
    MPI_Status status;
    MPI_Init( &argc, &argv );
    MPI_Comm_rank(MPI_COMM_WORLD, &rank);
    MPI_Comm_size(MPI_COMM_WORLD, &size);
    do {
        if (rank == 0) {
            scanf("%d", &value);
            MPI_Send(&value, 1, MPI_INT, rank + 1, 0,
MPI_COMM_WORLD);
        }
        else {
            MPI_Recv(&value, 1, MPI_INT, rank - 1, 0, MPI_COMM_WORLD,
&status);
            if (rank < size - 1)
                MPI_Send(&value, 1, MPI_INT, rank + 1, 0,
MPI_COMM_WORLD);
        }
    } while (rank < size - 1);
}
```

```

    }
    printf("Process %d got %d\n", rank, value);
} while (value >= 0);
MPI_Finalize();
return 0;
}

```

Conceptual Discussion: Conceptual Discussion: Rank is the rank of each processes and size is the total number of processes. "MPI_Comm_rank(MPI_COMM_WORLD, &rank);" ranks the processes, here 0, 1, 2, 3. Now the program will take a value from the user by process with rank 0 and send this value to the process with rank 'rank + 1', the next process. All the processes with rank not equal to 0 will receive the value from the process with one less rank. Upon receiving the value if their rank is less than 'size - 1' i.e. till second last process, they will send the value to the next process. This will go on until the user enters a negative value. The first entered negative value will also be distributed but no further value will be taken, then the program will terminate.

Execution:

```

PDC17BCI0140.c x
#include <stdio.h>
#include "mpi.h"
int main(argc, argv)
int argc;
char **argv;
{
    int rank, value, size;
    MPI_Status status;
    MPI_Init( &argc, &argv );
    MPI_Comm_rank(MPI_COMM_WORLD, &rank);
    MPI_Comm_size(MPI_COMM_WORLD, &size);
    do {
        if (rank == 0) {
            scanf("%d", &value);
            MPI_Send(&value, 1, MPI_
        }
        else {
            MPI_Recv(&value, 1, MPI_
            if (rank < size - 1)
                MPI_Send(&value,
            }
            printf("Process %d got %d\n", ra
        } while (value >= 0);
        MPI_Finalize();
        return 0;
    }
}

17bci0140@sjt418scs003: ~/Desktop
17bci0140@sjt418scs003:~/Desktop$ mpicc PDC17BCI0140.c -o A
17bci0140@sjt418scs003:~/Desktop$ mpirun -np 4 ./A
13
Process 0 got 13
Process 1 got 13
Process 2 got 13
Process 3 got 13
14
Process 0 got 14
Process 1 got 14
Process 2 got 14
Process 3 got 14
12
Process 0 got 12
Process 1 got 12
Process 2 got 12
Process 3 got 12
-1
Process 0 got -1
Process 1 got -1
Process 2 got -1
Process 3 got -1
17bci0140@sjt418scs003:~/Desktop$

```

Result: In this type of MPI broadcast the resources, here a value entered by user is distributed in a sequential manner till it reaches the last process.
